BOSCH ePowered

BOSCH SYSTEM CONTROLS

MINI REMOTE

More in-depth instructions on the Bosch Mini Remote can be found [here](#).

RIDING MODES

Use +/- buttons to select riding modes

- ECO** Efficient support for maximum range
- TOUR+** Consistent support for longer rides
- eMTB+** Dynamic support for a natural feel
- TURBO** Maximum support for challenging rides

1. + PLUS BUTTON

Increase support level/activate lights (if applicable) by holding down for 3 seconds

2. - MINUS/WALK ASSIST BUTTON

Reduce support level/activate walk assistance by holding down for 1 second while moving the bike

KIOX 400c

More in-depth instructions on the Bosch Kiox 400c can be found [here](#).

1. POWER BUTTON

A brief press turns on the e-bike, while holding for 3 seconds shuts it down

2. USB-C CHARGE PORT

Use to charge external devices

3. MODE BUTTON

Use the +/- button to select riding modes (see **RIDING MODES** next to Mini Remote)

4. SELECTION BUTTON

Use to switch screens and to access settings

PRECONFIGURED RIDE MODES

The Oso V2 ships with the following four modes preconfigured:

- **ECO**
- **TOUR+**
- **eMTB**
- **TURBO**

Bosch has five additional modes: **Eco+**, **Tour**, **Sport**, **Auto**, and **eMTB+** that can be installed onto the bike via the [Bosch Flow App](#). Riders can customize within the four installed ride modes as desired. Below, we detail settings for the preconfigured modes and the adjustments within each mode. All of these adjustments are made within the [Bosch Flow App](#).

THE DIALS EXPLAINED

LSC (LOW-SPEED COMPRESSION)

Affects how the suspension feels in the first 1/3 of its travel as the wheel tracks the trail. This adjustment is associated with small bump compliance and off-the-top sensitivity. Many riders aim to run minimal **LSC** while still maintaining a supported feel over smaller trail chatter.

HSC (HIGH-SPEED COMPRESSION)

Affects how the suspension feels in the last 2/3 of its travel as the wheel tracks the trail. This adjustment is associated with larger trail impacts and rough or rowdy terrain. Many riders find additional **HSC** to aid in heavy bottom-out scenarios and larger jumps/drops. There is a balance to be struck with this adjustment between compliance and support in the last portion of the suspension travel.

COMPRESSION

Compression damping adjustment controls compression stroke speed, or the rate at which the suspension compresses. Compression affects bump absorption and efficiency during rider weight shifts, transitions, cornering, bump impacts, and braking.

ABO (ADJUSTABLE BOTTOM OUT)

Affects how the suspension feels in the last 1/5 of its travel. ABO helps to manage deep-stroke impact resistance through an adjustable bottom out bumper. Many riders aim to run minimal ABO while still maintaining a supportive feeling in heavy bottom-out scenarios and larger jumps/drops.

Fork Compression Dials

ROCKSHOX LYRIK BASE
Fork Compression Dial

ROCKSHOX LYRIK ULTIMATE
Adjustable Bottom Out Dial

REBOUND

Affects how quickly the suspension recovers from trail impacts. Many riders aim to run as little rebound as tolerable, this increases wheel and suspension speed allowing the suspension to quickly rebound from repetitive trail impacts and chatter.

ROCKSHOX LYRIK BASE/ULTIMATE
Fork Rebound Dial

ROCKSHOX SUPER DELUXE SELECT+ w/LINEAR XL AIRCAN
Shock Rebound Dial

SHOCK LOCKOUT

When the lockout adjuster lever is in the **(A) Open position** the shock is able to compress quickly and freely through its full range of travel.

When the lockout adjuster lever is in the **(B) Lock position** the shock will resist compressing into its travel until significant bump impact or downward force occurs.

COMPRESSION

See explanation above.

ROCKSHOX SUPER DELUXE SELECT+ w/LINEAR XL AIRCAN
Shock Lockout Lever + Compression Dial

VOLUME SPACERS

Volume spacers are an optional step to fine-tune your suspension's air spring. The stock volume spacer configuration will work for most riders. See the charts below for volume spacer recommendations based on riding style.

Shock Volume Spacers

SET FORK SAG

- Make any desired changes to volume spacers before setting sag. The Rockshox Lyrik Ultimate on the Oso TR ships with **zero volume spacers installed**.
- Set your sag in **OPEN** mode with riding gear on. Sag should be set while standing in your descending position. Carefully dismount the bike without further compressing the suspension. Measure the distance between the sag indicator o-ring and the rubber air sleeve seal.
- Optimum Sag: **18-25%** of full travel at **160mm = 18.8mm to 40mm**.
- Once you have the sag set, use the charts to set compression and rebound settings.

SET FORK DAMPING

- Turn your damper adjuster to the open position (full counter clockwise) until it stops. You will hear and feel clicks as you turn the knob.
- These are just suggestions, so experiment until you find the settings that work for you.
- More clicks is less damping and faster suspension speed.

ROCKSHOX

More clicks and less air provides greater traction and a more plush suspension feel.

Less clicks and more air provides a more supportive and controlled suspension feel.

⚠ DO NOT EXCEED MAXIMUM AIR PRESSURE.

SET SHOCK SAG

- Make any desired changes to volume spacers before setting sag. The Rockshox Super Deluxe on the Oso TR ships with a **2 volume spacers installed**.
- Set the compression adjuster to the **OPEN** setting, fully counter-clockwise.
- The Rockshox Super Deluxe requires repeated actuation to equalize pressure between the two air chambers. With the air pump attached to the shock, slowly actuate your shock several times through its travel as you reach your desired pressure. This will equalize the positive and negative air chambers and will change the pressure on the pump gauge.
- Set your sag in **OPEN** mode with riding gear on. Sag should be set while standing in your descending position. Carefully dismount the bike without further compressing the suspension. Measure the distance between the sag indicator o-ring and the rubber air sleeve seal.
- Optimum Sag: **25-30%** of full travel, **60mm** stroke = **15mm to 18mm**.
- Once you have the sag set, use the charts to set compression and rebound settings.

ROCKSHOX

SET SHOCK DAMPING

- Turn your rebound and compression adjuster to the closed position (full clockwise) until it stops. You will hear and feel clicks as you turn the knob.
- These are just suggestions, so experiment until you find the settings that work for you.
- More clicks is less damping and faster suspension speed.

More clicks and less air provides greater traction and a more plush suspension feel.

Less clicks and more air provides a more supportive and controlled suspension feel.
