BOSCH ePowered

BOSCH SYSTEM CONTROLS

MINI REMOTE

More in-depth instructions on the Bosch Mini Remote can be found [here](#).

RIDING MODES

Use +/- buttons to select riding modes

- ECO** Efficient support for maximum range
- TOUR+** Consistent support for longer rides
- eMTB+** Dynamic support for a natural feel
- TURBO** Maximum support for challenging rides

1. + PLUS BUTTON

Increase support level/activate lights (if applicable) by holding down for 3 seconds

2. - MINUS/WALK ASSIST BUTTON

Reduce support level/activate walk assistance by holding down for 1 second while moving the bike

KIOX 400c

More in-depth instructions on the Bosch Kiox 400c can be found [here](#).

1. POWER BUTTON

A brief press turns on the e-bike, while holding for 3 seconds shuts it down

2. USB-C CHARGE PORT

Use to charge external devices

3. MODE BUTTON

Use the +/- button to select riding modes (see **RIDING MODES** next to Mini Remote)

4. SELECTION BUTTON

Use to switch screens and to access settings

MODE RECOMMENDATION

BOSCH FLOW APP

Start by downloading the [Bosch Flow App](#) and pairing your eBike via Bluetooth. Within the app, all four assistance modes are configurable to the rider's preference.

We recommend the following **TOUR+** configuration to achieve a ride experience that feels like a traditional mountain bike: speed directly tied to the rider's power output. This tuned-down mode is great for awkward sections of trail, passing other trail users, and calmer moments when you're seeking a more traditional bicycle feel. It's important to scale the assistance level by your power output; for stronger and heavier riders, -4 is a good choice. For lighter riders or those new to mountain biking, try -2.

TOUR+ CONFIGURATION

- 1. ASSISTANCE:** -4
- 2. DYNAMIC:** Default
- 3. MAX. TORQUE:** 100 Nm
- 4. MAX. POWER:** 750 W

THE DIALS EXPLAINED

COMPRESSION

Compression damping adjustment controls compression stroke speed, or the rate at which the suspension compresses. Compression affects bump absorption and efficiency during rider weight shifts, transitions, cornering, bump impacts, and braking.

ROCKSHOX PIKE
BASE | Fork Compression Adjust

SHOCK LOCKOUT

When the lockout adjuster lever is in the **(A) Open position** the shock is able to compress quickly and freely through its full range of travel.

When the lockout adjuster lever is in the **(B) Lock position** the shock will resist compressing into its travel until significant bump impact or downward force occurs.

ROCKSHOX DELUXE
(w/LINEAR XL AIRCAN)
SELECT+ | Shock Lockout Lever

REBOUND

Affects how quickly the suspension recovers from trail impacts. Many riders aim to run as little rebound as tolerable, this increases wheel and suspension speed allowing the suspension to quickly rebound from repetitive trail impacts and chatter.

BASE | Fork Rebound Dial

ROCKSHOX DELUXE
(w/LINEAR XL AIRCAN)
SELECT+ | Shock Rebound Dial

VOLUME SPACERS

Volume spacers are an optional step to fine-tune your suspension's air spring. The stock volume spacer configuration will work for most riders. See the charts below for volume spacer recommendations based on riding style.

SET FORK SAG

- Make any desired changes to volume spacers before setting sag. The Rockshox Pike Base on the Oso S ships with **zero volume spacers installed**.
- Set your sag in **OPEN** mode with riding gear on. Sag should be set while standing in your descending position. Carefully dismount the bike without further compressing the suspension. Measure the distance between the sag indicator o-ring and the rubber air sleeve seal.
- Optimum Sag: **18-25%** of full travel at **140mm = 25.2mm to 35mm**.
- Once you have the sag set, use the charts to set compression and rebound settings.

ROCKSHOX

SET FORK DAMPING

- Turn your damper adjuster to the open position (full counter clockwise) until it stops. You will hear and feel clicks as you turn the knob.
- These are just suggestions, so experiment until you find the settings that work for you.
- More clicks is less damping and faster suspension speed.

More clicks and less air provides greater traction and a more plush suspension feel.

Less clicks and more air provides a more supportive and controlled suspension feel.

MAX		163	24	CLOSED	8	8

⚠ DO NOT EXCEED MAXIMUM AIR PRESSURE.

SET SHOCK SAG

- Make any desired changes to volume spacers before setting sag. The Rockshox Deluxe on the Oso S ships with a **1 volume spacer installed**.
- Set the climb switch lever to open (towards the drive side).
- Set your sag in **OPEN** mode with riding gear on. Sag should be set while standing in your descending position. Carefully dismount the bike without further compressing the suspension. Measure the distance between the sag indicator o-ring and the rubber air sleeve seal.
- Optimum Sag: **25-30%** of full travel, **52.5mm stroke = 13.25mm to 15.75mm**.
- Once you have the sag set, use the charts to set compression and rebound settings.

SET SHOCK DAMPING

- Turn your rebound and open adjustment mode knobs clockwise to the closed position, the last click. Then back them out to the number of clicks shown in the table below.
- These are just suggestions, so experiment until you find the settings that work for you.
- More clicks is less damping and faster suspension speed.

SAG: 25-30%

ROCKSHOX
